Test Conditions:

1. IF= 20mA (one channel), the ambient temperature is 25°C.
2. The test systems refer to Note 1 and Note 2.

Note 1: Definition of optical measurement system.

The optical characteristics should be measured in dark room. After 10 Minutes operation, the optical properties are measured at the center point of the LCD screen. All input terminals LCD panel must be ground when measuring the center area of the panel.

Item	Photo Detector	Field
Contrast Ratio	SR-3A	1°
Contrast Ratio		
Contrast Ratio		
Contrast Ratio		
Contrast Ratio	BM-7A	2°

Note 2: Definition of viewing angle range and measurement system.

viewing angle is measured at the center point of the LCD by CONOSCOPE(ergo-80)

Note 3: Definition of contrast ratio

Contrast Ratio (CR)= Luminance measured when LCD is on “White” state/Luminance measured when LCD is on “Black” state

“White state “: The state is that the LCD should be driven by V_{white} (V_{white} : To be determined). “Black state: The state is that the LCD should be driven by V_{black} (V_{black} : To be determined).

The response time is defined as the LCD optical switching time interval between “White” state and “Black” state. Rise time (T_{ON}) is the time between photo detector output intensity changed from 90% to 10%. And fall time (T_{OFF}) is the time between photo detector output intensity changed from 10% to 90%.

Note 5: Definition of color chromaticity (CIE1931) Color coordinates measured at center point of LCD.

Note 6: Definition of Luminance Uniformity

Active area is divided into 9 measuring areas. Every measuring point is placed at the center of each measuring area. L_{max} : The measured Maximum luminance of all measurement position. L_{min} : The measured Minimum luminance of all.

Note 7: Definition of Response time

Note 8: Definition of Luminance: Measure the luminance of white state at center point. Left/right 0° Top/bottom 5°

Note 9: If LED is driven by high current, high ambient temperature & humidity condition. The life time of LED will be reduced. Operating life means brightness goes down to 50% initial brightness. Typical operating life time is estimated data.

8. PRECAUTIONS

8.1 ASSEMBLY AND HANDLING PRECAUTIONS

- Do not apply rough force such as bending or twisting to the module during assembly.
- To assemble or install module into user's system can be only in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- It's not permitted to have pressure or impulse on the module because the LCD panel and Backlight will be damaged.
- Always follow the correct power sequence when LCD module is connecting and operating. This can prevent damage to the CMOS LSI chips during latch-up.
- Do not pull the I/F connector in or out while the module is operating.
- Do not disassemble the module.
- Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- It is dangerous that moisture come into or contacted the LCD module, because moisture may damage LCD module when it is operating.
- High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- When ambient temperature is lower than 10°C may reduce the display quality. For example, the response time will become slow.
- Do not keep same pattern in a long period of time. It may cause image sticking on LCD.

8.2 SAFETY PRECAUTIONS

- Do not disassemble the module or touch the backlight array.
- If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- After the module's end of life, it is not harmful in case of normal operation and storage.
